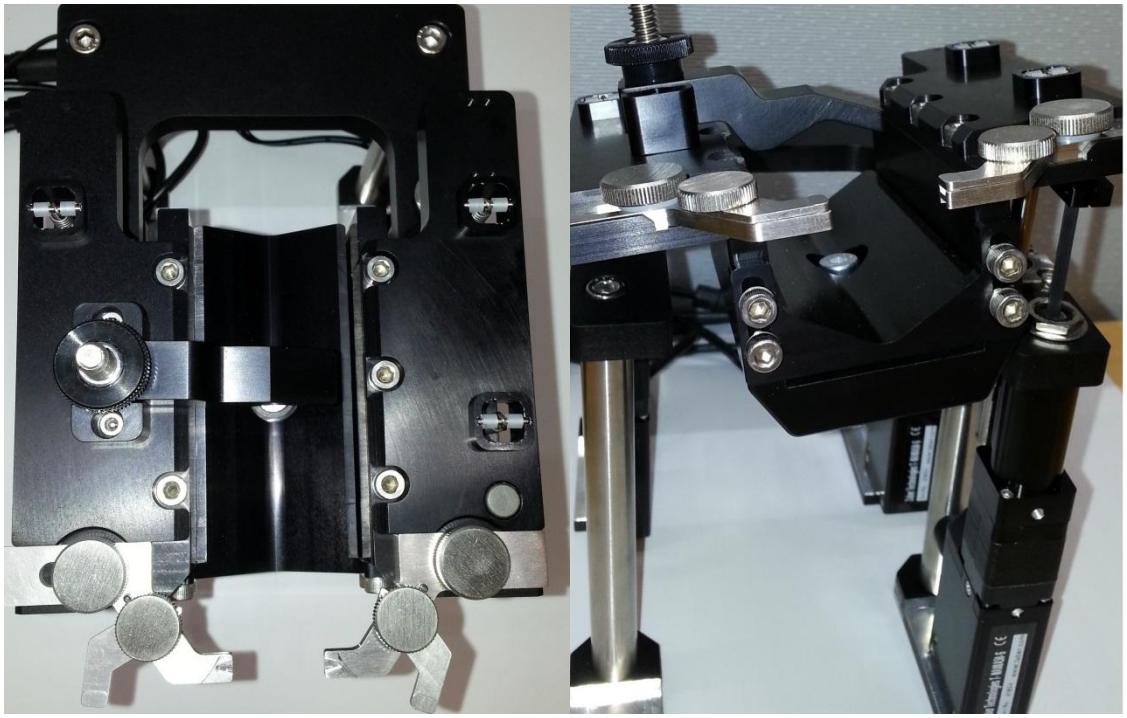
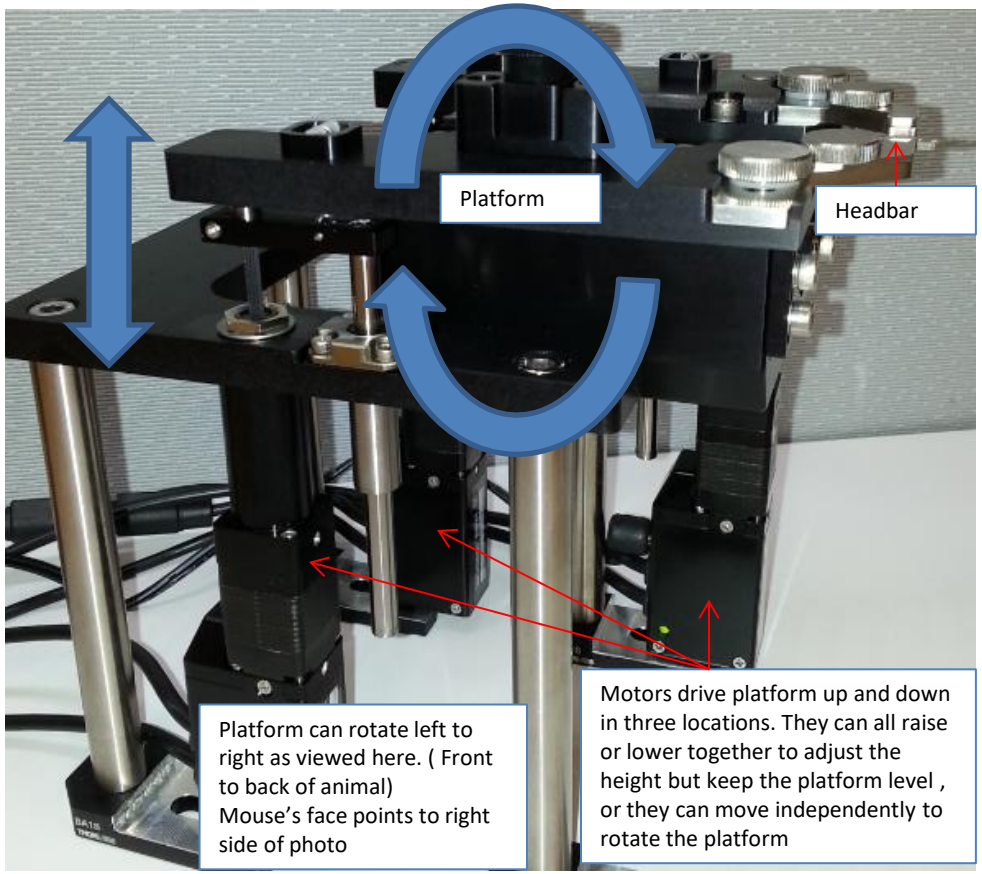
Tip-Tilt-Z Sample Positioner

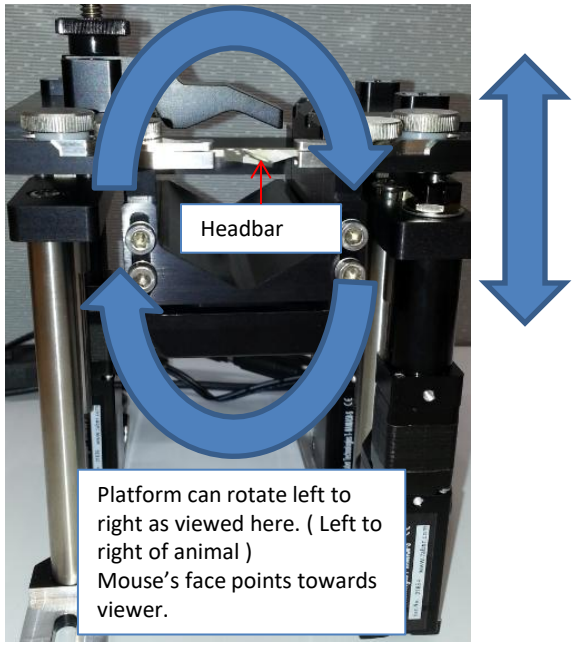


The Tip-Tilt-Z Sample Positioner provides automated rotation of a head-fixed rodent specimen about the anterior-posterior and medio-lateral axes for imaging or other purposes. The device also provides automated Z translation and can be customized to accommodate various head bar designs.

- Rotation range, each axis: +/-10 deg
- Z travel varies depending on angular orientation of sample:
  minimum Z travel: +/- 8.5 mm
  maximum Z travel : +/- 25mm
- Precision actuators allow for micron-level repeatability



Platform
Headbar
Platform can rotate left to right as viewed here. (Front to back of animal)
Mouse's face points to right side of photo
Motors drive platform up and down in three locations. They can all raise or lower together to adjust the height but keep the platform level , or they can move independently to rotate the platform



Headbar
Platform can rotate left to right as viewed here. (Left to right of animal)
Mouse's face points towards viewer.
